Mobile Login Requests (Push Notifications) Registration Method for 2-Factor Authentication
Use this guide to configure and register mobile devices to use Push Notifications as a 2-Factor Authentication registration method.

SecureAuth IdP supports two (2) types of Push options for 2-Factor Authentication: Push Notification (alert) and Push-to-Accept.

The Push Notification alert message is sent directly to a mobile device and includes a one-time passcode (OTP) to use during the 2-Factor Authentication workflow. Push-to-Accept sends a login request to a mobile device that prompts the end-user to Accept or Deny access.

To use either of these Push options, the Push Notifications functionality must be enabled in all realms designated to offer the option, and end-users must register their mobile device(s) to receive the notifications before utilizing the registration method during login.

When end-user Push Notification requests are submitted, SecureAuth IdP builds a tunnel using Apple APN and Google GCM services to distribute custom messages to registered mobile devices.

**Push-to-Accept Architecture**

1. Select Push-to-Accept
2. Request Push-to-Accept
3. Wait
4. Request Push for Push-to-Accept
5. Push Notification
6. Pull Detail Info
7. Return Detail Info
8. UI Prompt
9. Tap Accept / Deny
10. Respond Accept / Deny
11. Respond Accept / Deny
12. Update View

This is the SecureAuth IdP 8.2 version of this document. For other versions of this document, see:
Prerequisites

1. Download the SecureAuth IdP Mobile OTP App from the Google Play Store or Apple App Store

<table>
<thead>
<tr>
<th>Device</th>
<th>Download URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>iOS</td>
<td><a href="https://itunes.apple.com/us/app/secureauth-otp/id615536686">https://itunes.apple.com/us/app/secureauth-otp/id615536686</a></td>
</tr>
</tbody>
</table>

NOTE: See SecureAuth Compatibility Guide for a list of supported, compatible mobile devices

2. Configure the SecureAuth App Enrollment Realm where end users can register their device(s) for Push Notification

3. Create a New Realm or access existing realm(s) in the SecureAuth IdP Web Admin to which the Push Notification will be applied (Realm A in the SecureAuth IdP Configuration Steps)

(Optional) 4. Create a New Realm or access an existing realm in the SecureAuth IdP Web Admin that is configured for the Account Management page (help desk) to enable administrator Push Notification enrolled device(s) revocation (Realm B in the SecureAuth IdP Configuration Steps)

(Optional) 5. Create a New Realm or access an existing realm in the SecureAuth IdP Web Admin that is configured for the Self-service Account Update (end user self service) to enable end user Push Notification enrolled device(s) self-revocation (Realm C in the SecureAuth IdP Configuration Steps)

6. Configure the following tabs in the Web Admin before configuring Push Notifications (and Account Management Page and Self-service Account Update):

- **Overview** – the description of the realm and SMTP connections must be defined
- **Data** – an enterprise directory must be integrated with SecureAuth IdP
- **Workflow** – the way in which users will access the target must be defined
- **Registration Methods** – other 2-Factor Authentication methods that will be used to access the target (if any) must be defined
- **Post Authentication** – the target resource or post authentication action must be defined (see Realm B and Realm C for specific Post Authentication configurations for Account Management Page and Self-service Account Update)
- **Logs** – the logs that will be enabled or disabled for this realm must be defined

SecureAuth IdP Configuration Steps

[Add Property]
1. In the Membership Connection Settings section, map a directory field to the Push Notification Tokens Property.

   In typical AD deployments, the Data Format is Plain Binary and the jpegPhoto directory field is utilized.

2. Check Writable.

   The Push Notification Tokens Property can be stored as Plain Binary or in JSON format, and has distinct requirements for the LDAP directory attribute mapped to the Property based on the Data Format selection.

   For **Plain Binary**, these requirements must be met for the directory field that contains the Push Notification Token:

   - **Length**: 4096 minimum
   - **Data Type**: Octet string (bytes)
   - **Multi-valued**

   For **JSON**, these requirements must be met for the directory field that contains the Push Notification Token:

   - **Length**: 4096 minimum
   - **Data Type**: DirectoryString
   - **Multi-valued**

   **NOTE**: For SQL, ASP.net, and Oracle data stores, only the Plain Binary Data Format is supported (configured in the Data tab); and for ODBC data stores, Push is not supported.

   **Click Save** once the configurations have been completed and before leaving the Data page to avoid losing changes.
3. In the Registration Configuration section, under Mobile Login Requests (Push Notifications), select Passcode (OTP), Accept / Deny, or Passcode (OTP) + Accept / Deny from the Request Type dropdown.

- **Passcode (OTP):** Enable Push Notifications to enrolled mobile devices
- **Accept / Deny:** Enable Push-to-Accept requests to enrolled mobile devices
- **Passcode (OTP) + Accept / Deny:** Enable Push Notifications and Push-to-Accept requests to enrolled mobile devices (both options appear on client-side login page)

4. If Accept / Deny or Passcode (OTP) + Accept / Deny is selected in step 3, then set the Login Request Timeout to determine the number of minutes during which the Push-to-Accept request is valid.

5. If Accept / Deny or Passcode (OTP) + Accept / Deny is selected in step 3, then set the Company Name, which appears on the Push-to-Accept request.

6. If Accept / Deny or Passcode (OTP) + Accept / Deny is selected in step 3, then set the Application Name to a descriptive name / phrase, which appears on the Push-to-Accept request.

7. Set the Device Max Count to -1 if there is no limit to the number of devices that can be enrolled for Push Notifications.

   To establish a limit, set the maximum number of devices that can be enrolled for Push Notifications.

8. If a max count is set, select Allow to replace from the When exceeding max count dropdown if end users can replace existing enrolled devices with newer ones.

9. If a max count is set and Allow to replace is selected in step 8, then select Created Time from the Replace in order by dropdown to replace the oldest enrolled device with the newest one.

   Select Last Access Time to replace the least recently used enrolled device with the newest one.
Realm B

These are optional configuration steps to enable administrator (help desk) revocation of Push Notification enrolled device(s).

This realm must be set up for the Account Management page post authentication action.

Refer to Account Management (Help Desk) Page Configuration Guide for more information.

Data

1. Follow steps 1-2 in the Data configuration steps of Realm A.

   The directory attribute used for Push Notification Tokens (e.g. jpegPhoto) must be the same across all SecureAuth IdP realms utilizing Push Notifications / Push-to-Accept Login Requests to ensure consistency.

Post Authentication

2. In the Post Authentication section, select Account Management from the Authenticated User Redirect dropdown.

   Click Save once the configurations have been completed and before leaving the Post Authentication page to avoid losing changes.

Identity Management

3. Click Configure help desk page to enable or disable help desk functions.

**Data was updated successfully.**

---

**Realm C**

These are *optional* configuration steps to enable end user self-service revocation of Push Notification enrolled device(s).

This realm must be set up for the **Self-service Account Update** post authentication action.

Refer to **Self-service Account Update Page Configuration Guide** for more information.

---

**Data**

1. Follow steps 1-2 in the **Data** configuration steps of **Realm A**.

The directory attribute used for Push Notification Tokens (e.g. jpegPhoto) **must be the same** across all SecureAuth IdP realms utilizing Push Notifications / Push-to-Accept Login Requests to ensure consistency.

---

**Post Authentication**
2. Select **Self Service Account Update** from the **Authenticated User Redirect** dropdown in the **Post Authentication** tab in the Web Admin.

⚠️ **Click** **Save** once the configurations have been completed and before leaving the **Post Authentication** page to avoid losing changes.

3. Click **Configure self service page** to enable or disable self-service functions.

4. Select **Show Enabled** from the **Push Notification Devices** dropdown to show this function on the help desk page and enable self-revocation of enrolled devices.

Digital Fingerprints (Uncheck to revoke)

Push notification devices (uncheck to remove)

Click **Save** once the configurations have been completed and before leaving the **Self-service** page to avoid losing changes.

**End-user Experience**

End-users must enroll their mobile devices (**Authenticate App**) in the **SecureAuth App Enrollment Realm** to use Push Notification and / or Push-to-Accept as Multi-Factor Authentication methods.

**NOTE:** Workflows for Authenticate App versions 5.0 and 4.x differ due to architectural changes in the app. Refer to the sample images for the version of the app installed – **v5.0** or **v4.x** – for the specified type of Push Notification.
In **SecureAuth IdP v9.0.2+**, when the end-user is presented the page of Multi-Factor Authentication methods from which to choose, the Multi-Factor Authentication method that was last selected and used in a successful login attempt persists as the default method for the next login in each device / browser.

**Passcode (OTP) Request Type (Push Notification)**

1. When logging on a SecureAuth IdP realm in which the Passcode (OTP) Push Notification login request type is enabled, the **Push Notification** choice appears in the Multi-Factor Authentication methods list.

2. Select **Send passcode** and click **Submit**

3. A passcode Push Notification is delivered to the app on the enrolled device, displayed on the home screen, with the OTP.
SecureAuth now
Your one time password is 1039,slide to view
1. When logging on a SecureAuth IdP realm in which the Accept / Deny Push Notification login request type is enabled, the **Push-to-Accept** choice appears in the Multi-Factor Authentication methods list.

2. Select **Send login request** and click **Submit**.

3. A Push-to-Accept request is delivered to the enrolled app on the device, ready for the end-user's approval or denial response on the app.

If the end-user does not respond to the request within the configured time period,

- "The request has expired" message appears on the app.
- "The login request is no longer valid" message appears on the realm page along with the link "Please click here to use an alternate verification method".
