

VMware

"VMware is the recognized leader in virtualization and automation of compute, networking and storage resources from the desktop to the data center and to the cloud. Our technologies and the open standards they support provide a powerful foundation."

SecureAuth IdP & VMware

VMware provides cloud and virtualization software and services. SecureAuth IdP can be added to the environment to protect the devices as an extra layer of security.

SecureAuth IdP can integrate with VMware products using RADIUS authentication. Because SecureAuth IdP is so versatile in its authentication and assertion abilities, it can easily and safely deliver users to the device to then gain entry into other resources.

Acting as a RADIUS Server, SecureAuth IdP authenticates users via the RADIUS protocol to securely enable access to a RADIUS Client (VMware Horizon, for example).
